Best Stock Dilution Trackers in 2026 (Ranked & Reviewed)

SEC - Tools & Comparisons - March 22, 2026

We tested 7 dilution trackers on SEC alert speed, ATM coverage, warrant monitoring, and price. The top pick has a free tier. See the full rankings.

Stock dilution is one of the most overlooked risks in retail investing, particularly for traders active in small-cap and micro-cap stocks. A company can quietly issue millions of new shares through an ATM program, a PIPE transaction, or a warrant exercise - and unless you're watching SEC filings closely, you'll find out when the price has already dropped.

This roundup covers every dedicated dilution tracking tool we're aware of in 2026 - paid platforms, free alternatives, and the "build your own" approach via EDGAR directly. We've tried to be genuinely fair to each: what they do well, where they fall short, and who each one is actually useful for.

Disclosure: This article is published by TraderTools. We've done our best to present the competitive landscape accurately, but you should factor that in when reading the rankings.

1. TraderTools - Best for Active Investors

Rank #1

TraderTools

Free tier - $19.95/month Basic - $39.95/month Premium

TraderTools monitors 8,500+ active US-listed tickers across 25+ SEC filing types, scanning EDGAR every 60 seconds. It generates AI-powered filing summaries, a composite DilutionScore? for each company, and timely alerts for dilutive events including ATM programs, shelf registrations, PIPE transactions, warrant exercises, reverse splits, and more.

? Pros

* Free tier to start
* 8,500+ active tickers monitored
* 60-second EDGAR scanning
* 25+ filing types tracked
* AI filing summaries
* DilutionScore? composite risk
* API access (separate plans)
* Mobile-friendly
* Lowest price at each tier

? Cons

* Newer platform vs competitors
* Historical depth still building
* Best features require paid plan

Bottom line: The strongest all-around option for active investors who need broad coverage, timely alerts, and don't want to pay $60+/month for a tool with narrower scope.

TraderTools was built around a core insight: most retail investors find out about dilutive events after the damage is done. By the time a PIPE transaction or new ATM program shows up in a quarterly filing, the stock has already repriced. A 60-second scanning interval is an attempt to close that information gap.

The DilutionScore? system is particularly useful for investors who don't have time to read every filing. It aggregates risk factors - active ATM programs, cash runway under 6 months, recent large share issuances, existing warrant overhang - into a single score that lets you triage quickly. For background on what drives that score, see our explainers on ATM offerings and shelf registrations.

2. DilutionTracker - Best for Deep Micro-Cap Research

Rank #2

DilutionTracker

$60-74/month (no free tier)

DilutionTracker is one of the original dedicated dilution tracking platforms, with strong historical data on the small-cap and micro-cap stocks it covers. It focuses specifically on the dilution history of companies - share count changes, financing history, outstanding warrants - for approximately 2,300 stocks in its universe.

? Pros

* Established platform with track record
* Strong historical data on covered stocks

* Good research tools for deep dives
* Focused on dilution - not diluted by other features

? Cons

* $60-74/month - expensive vs alternatives
* No free tier
* Only ~2,300 stocks covered
* Delayed/EOD data - not real-time
* No API access
* Web only - no mobile app
* No AI summaries

Bottom line: Good for investors doing methodical research on a focused list of known dilutors. Not the right tool if you need timely alerts, broad coverage, or price sensitivity.

DilutionTracker has been around long enough to have earned a following in the micro-cap trading community. If your workflow involves doing deep historical analysis on a company's capital raise history before taking a position, the platform serves that purpose well. The limitation is the coverage ceiling - if a stock you're looking at isn't in their ~2,300 ticker database, you're out of luck, and at $60-74/month, that's a meaningful gap to accept.

3. Dilutracker - Institutional Focus, Limited Accessibility

Rank #3

Dilutracker

Not publicly listed - institutional pricing focus

Dilutracker positions itself as an "institutional-grade" dilution tracking platform, covering approximately 3,000 stocks. Notable limitation: a 24-hour processing delay on data. This makes it less useful for active traders who need to act on new filings quickly.

? Pros

* ~3,000 stock coverage
* Institutional-grade data presentation
* Comprehensive dilution history

? Cons

* 24-hour processing delay
* Pricing not publicly listed
* Institutional focus - less accessible for retail
* Coverage still narrower than TraderTools
* No free tier

Bottom line: May suit institutional teams that prioritize data quality over speed. For retail investors or active traders, a 24-hour delay is a hard constraint.

Dilutracker's 24-hour processing delay is a fundamental design trade-off - they appear to prioritize data completeness and validation over speed. For an institutional analyst building a model on a company's 5-year dilution history, that may be acceptable. For anyone trying to get ahead of a

filing that dropped this morning, it's a blocker. Pricing being opaque is another friction point for individual investors evaluating options.

4. AskEdgar - Best for Broad AI Filing Analysis

Rank #4

AskEdgar

Higher-priced - primarily professional focus

AskEdgar is an AI-powered platform for analyzing SEC filings broadly - not just dilution-specific events, but the full range of SEC documents. It uses large language models to let you query filings in natural language, making it useful for legal, compliance, and professional investment research contexts.

? Pros

* Covers all SEC filers, not just dilution-focused
* Strong AI-powered filing analysis
* Natural language queries across filings
* Good for broad fundamental research
* Near real-time filing access

? Cons

* More expensive - professional pricing
* Not purpose-built for dilution tracking
* No DilutionScore-equivalent risk metric
* Broader focus means less dilution-specific depth
* Overkill for investors focused specifically on dilution

Bottom line: A good tool for professional analysts who need broad SEC filing research with AI. Not the right choice if dilution tracking is your primary use case and budget matters.

AskEdgar occupies a different category from the other tools on this list - it's an AI research assistant that happens to cover SEC filings, rather than a purpose-built dilution tracker. If you're a portfolio manager, compliance officer, or analyst who needs to research across all types of filings (not just dilutive events), it's worth evaluating. If you specifically need to know when a micro-cap company just filed a new ATM program, you want a dedicated dilution tracker.

5. Free Options - KFilings and SEC EDGAR Direct

Free Tier

KFilings / SEC EDGAR Direct

Free

For investors who want to track SEC filings without paying for a dedicated tool, there are two primary options: KFilings (a free filing alert service) and SEC EDGAR directly. Both provide access to the same underlying filing data - what they lack is the interpretation layer.

? Pros

* Completely free

* Access to all SEC filings in real-time
* EDGAR has a public API
* No coverage limits - every public company
* Direct source - no intermediary

? Cons

* No automated dilution analysis
* You have to read and interpret filings yourself
* No risk scoring or alerts
* EDGAR UI is not designed for quick screening
* Significant time investment required
* Easy to miss key details buried in filings

Bottom line: Free is free - and EDGAR is the underlying data source for everything else on this list. But turning raw filings into actionable intelligence requires either significant time investment or a tool that does it for you.

KFilings provides free email alerts when companies file specific form types with the SEC. You can set up watchlists by ticker and receive notifications for 8-K, S-3, 424B3, and other filings. It's a genuinely useful free tool - the limitation is that it delivers raw filing notifications without any analysis. You still need to read the filing and understand what the dilution implications are.

SEC EDGAR itself is freely accessible at edgar.sec.gov and also provides a public EDGAR API for developers. If you're comfortable building your own tools or have the technical background to parse XML filing feeds, you can construct a customized dilution alert system from scratch at zero cost. Our article on ATM offerings and related explainers can help you understand what to look for when reading these filings.

?? The DIY Trap

Building your own EDGAR monitoring system is technically feasible but easily becomes a part-time job. Most investors find that $19.95/month for a tool that does this reliably is a better use of their time than maintaining custom software.

How to Choose the Right Tool

The right dilution tracker depends on your specific situation. Here's a quick decision framework:

* You're new to dilution tracking -> Start with TraderTools's free tier. Get comfortable with the filing types and risk signals before paying.
* You're an active trader monitoring a broad universe -> TraderTools Basic ($19.95/mo) is the value leader - 8,500+ active tickers, 60-second scanning, DilutionScore?.
* You need API access for custom tools -> TraderTools's API plans (from $79.95/mo) or EDGAR's free public API.
* You do deep research on a focused list of known micro-cap dilutors -> DilutionTracker has historical depth, but you're paying 3x the price of TraderTools Basic for narrower coverage.
* You're an institutional team doing broad AI-powered SEC research -> AskEdgar may be worth evaluating, though it's not purpose-built for dilution tracking.
* Your budget is zero -> KFilings for alerts + EDGAR direct for research is a workable free stack, just time-intensive.

? The Underlying Question

What are you trying to accomplish? If the answer is "know when any stock I'm watching is about to be diluted, before it happens" - that's timely alerts coverage across a wide ticker universe. That's what TraderTools is optimized for.
